

# MIX YOUR WAY TO SOIL SUCCESS IN 4 EASY STEPS

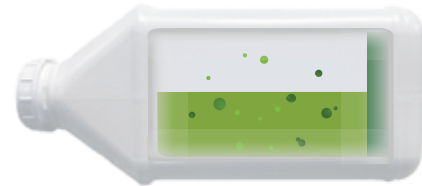

## STEP 1

Pour half the product into tank solution.

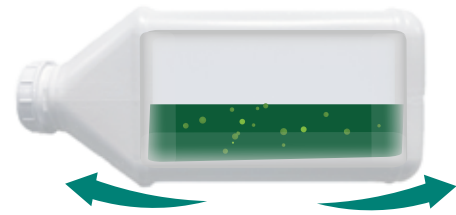

## STEP 2

Re-cap jug and turn flat on its side. It is normal for there to be some sediment at the bottom of the jug.

## STEP 3

Shake side to side and back and forth vigorously for 15 seconds. This will help release sediment build up at bottom of jug.

## STEP 4

Empty remaining jug contents into tank solution.

### SHORT CUT

Product can also be agitated by a power drill with a paint mixing attachment. Use the lowest setting on the drill to prevent splattering.

### PHYCOTERRA® USE WITH CHEM BLADES

If using a chem blade to mix/rinse PhycoTerra® jugs, steps 1 to 3 must be performed prior to use of chem blade.

### IMPORTANT TO READ

If a persistent residue layer is noticed at the bottom of the jug after performing agitation steps, there is no need for concern. PhycoTerra® is an inert soil amendment and this layer will not impact performance in the tank or in the field.
