

Jug Agitation Instructions for SOIL AMENDMENT | ORGANIC SOIL AMENDMENT | FX FOLIAR TREATMENT

IMPORTANT TO READ

If a persistent layer remains on the inside of the jug after agitation, there is no cause for concern. PhycoTerra® is an inert microalgae product, and this residue will not affect performance in the tank or in the field.

5 Easy Steps

STEP 1

Option 1

Remove the cap from the jug and agitate product by using a power drill with a paint mixing attachment. Use the lowest speed setting and in reverse on the drill to prevent splattering.

Option 2

Leave the cap on the jug. Vigorously shake the jug for 30–45 seconds, alternating between side-to-side and upside-down motions.

STEP 2

Pour half the product into tank solution.

Skip steps 3-4 if there is no persistent layer of product visible on the inside of the jug.

STEP 3

Re-cap jug and turn flat on its side. Some sediment at the bottom of the jug is normal.

STEP 4

Shake side-to-side and back and forth vigorously for 30 seconds. This will help release sediment build up at bottom of jug.

STEP 5

Empty jug contents into tank solution.

PhycoTerra Use with Chem Blades

If using a chem blade to mix/rinse PhycoTerra jugs, steps 1 to 3 must be performed prior to use of chem blade.
